INVESTICE DO ROZVOJE VZDĚLÁVÁNÍ

Jméno autora: Mgr. Mária Filipová

Datum vytvoření: 12. 09. 2013

Číslo DUMu: VY_32_INOVACE_08_AJ_FT

Ročník: 1. – 4. ročník

Vzdělávací oblast: Jazyk a jazyková komunikace

Vzdělávací obor: Anglický jazyk

Tematický okruh: odborná slovní zásoba a téma pro studenty oboru Aplikovaná chemie

Téma: Poisonous plants

Klíčová slova: poisonous, lethal, toxine, summer

Metodický list/anotace:

Materiál slouží k seznámení se základní odbornou slovní zásobou pro studenty oboru Aplikovaná chemie.

Jedná se zejména o termíny z oblasti biologie a chemie.

Studenti odhadují na základě svých znalostí význam slov. V případě potřeby pracují se slovníkem. Důležité je pochopení obsahu a aktivní slovní zásoba. Studenti využívají svých znalostí z oboru chemie, biologie a mikrobiologie.

Připraví krátkou prezentaci se zajímavými informacemi.

Poisonous plants

summer

Cicuta virosa – pic. 1

Cicuta virosa

- *Cicuta virosa* (Cowbane or Northern Water Hemlock) is a species native to northern and central Europe, northern Asia and northwestern North America. It is a perennial herbaceous plant which grows up to 1–2 m tall.
- The plant contains cicutoxin, which disrupts the workings of the central nervous system. In humans, cicutoxin rapidly produces symptoms of nausea, emesis and abdominal pain, typically within 60 minutes of ingestion.
- A single bite of the root (which has the highest concentration of cicutoxin) can be sufficient to cause death.

Conium maculatum - pic. 2

Conium maculatum

- Conium is a genus of one or two species of highly poisonous perennial flowering plants in the family Apiaceae, native to Europe and the Mediterranean region.
- The most noted of these chemicals is *coniine*, which has a chemical structure and pharmacological properties similar to nicotine. Coniine disrupts the workings of the central nervous system. In high enough concentrations Coniine can be dangerous to humans and livestock. Due to high potency, the ingestion of seemingly small doses can easily result in respiratory collapse and death.
- In ancient Greece, hemlock was used to poison condemned prisoners. The most famous victim of hemlock poisoning is the philosopher Socrates.

Atropa belladonna – pic.3

Atropa belladonna

- Atropa belladonna is a perennial plant in the family Solanaceae, native to Europe, North Africa, and Western Asia. The foliage and berries are extremely toxic, containing *tropane alkaloids*. These toxins include *scopolamine* and *hyoscyamine* which cause a bizarre delirium and hallucinations. The drug *atropine* is derived from the plant.
- It has a long history of use as a medicine, cosmetic, and poison. Before the Middle Ages, it was used as an anesthetic for surgery; the ancient Romans used it as a poison.
- Belladonna is one of the most toxic plants found in the Eastern Hemisphere. All parts of the plant contain tropane alkaloids. The berries pose the greatest danger to children because they look attractive and have a somewhat sweet taste. The consumption of two to five berries by a human adult is probably lethal.

Thuja – pic.4

Thuja

- *Thuja* is a genus of coniferous trees in the Cupressaceae (cypress family). There are five species in the genus, two native to North America and three native to eastern Asia.
- Oil of *thuja* contains the terpene *thujone* with potentially lethal properties.

Other poisonous plants

- *Datura stramonium* - Jimson weed or datura
- *Veratrum album* - false helleborine, white hellebore
- *Ricinus* - castor oil plant
